# HD & HDSA

Huntington's Disease (HD) is a genetic disorder that causes the progressive breakdown of nerve cells in the brain. It deteriorates a person's physical and mental abilities usually during their prime working years, and is ultimately fatal.

HD manifests as a triad of motor, cognitive and psychiatric symptoms, which progressively get worse over time. The symptoms of HD are often described as having ALS, Parkinson's, and Alzheimer's disease - simultaneously.

Every child of a parent with HD has a 50/50 chance of inheriting the faulty gene that cause the disease. Today, there are approximately 41,000 symptomatic Americans and 200,000 people in the United States at-risk of inheriting HD. In less than 10% of cases, juvenile Huntington's disease (JHD) affects children & adolescents.
